2022-2026-CSE-AIML

## Aim:

Write a class Box which contains the data members width, height and depth all of type double.

Write the implementation for the below **3**overloaded constructors in the class Box:

- Box() default constructor which initializes all the members with -1
- **Box(length)** parameterized constructor with one argument and initialize all the members with the value in **length**

the members with the corresponding arguments

· Box(width, height, depth) - parameterized constructor with three arguments and initialize

Write a method public double volume() in the class Box to find out the volume of the given box.

Write the **main** method within the Box class and assume that it will receive either **zero** arguments, or **one** argument or **three** arguments.

For example, if the main() method is passed zero arguments then the program should print the output as:

```
Volume of Box() is : -1.0
```

Similarly, if the main() method is passed one argument : 2.34, then the program should print the output as:

```
Volume of Box(2.34) is : 12.81290399999998
```

then the program should print the output as: Likewise, if the **main()** method is passed **three** arguments : **2.34, 3.45, 1.59**, then the program should print the output as:

```
Volume of Box(2.34, 3.45, 1.59) is : 12.83607000000001
```

Note: Please don't change the package name.

## **Source Code:**

```
q11267/Box.java
```

```
package q11267;
import java.io.*;
import java.util.*;
class Box
{
    double w,h,d;
    Box()
    {
        d=-1;
        w=-1;
        h=-1;
    }
    Box(double length)
    {
        h=length;
        w=length;
        d=length;
        d=length;
    }
}
```

```
Box(double width,double height,double depth)
        w=width;
        h=height;
        d=depth;
      }
     public double volume()
         return w*h*d;
      }
      public static void main(String a[])
         if(a.length==0)
            Box b=new Box();
            System.out.println("Volume of Box() is : "+b.volume());
         else if(a.length==1)
            double len = Double.parseDouble(a[0]);
            Box b=new Box(len);
            System.out.println("Volume of Box("+len+") is : "+b.volume());
         }
         else
         {
            double w= Double.parseDouble(a[0]);
            double h= Double.parseDouble(a[1]);
            double d= Double.parseDouble(a[2]);
            Box b=new Box(w,h,d);
            System.out.println("Volume of Box("+w+", "+h+", "+d+") is : "+b.volume
());
         }
      }
}
```

## Execution Results - All test cases have succeeded!

```
Test Case - 1
User Output
Volume of Box() is : -1.0
```

```
Test Case - 2
User Output
Volume of Box(3.0) is : 27.0
```

```
Test Case - 3
User Output
Volume of Box(2.3, 3.5, 6.5) is : 52.32499999999999
```
